

AGE OF STEAM EXPANSION VOL. V MAP RULES

D.C. METRO

D.C. Metro is a map for 1 to 3 players by Dylan D. Phillips.

The Metrorail serving Washington, D.C., Maryland and Virginia opened in 1976. With 129 miles of rail and over half a million daily riders, the Washington Metro serves commuters, politicians and tourists, moving from station to station to change lines.

Components

- 'Closed Station' marker (for solo mode)
- 14 white cubes (from base game)

Setup

Randomly place 2 Goods cubes on National Airport and 4 Goods cubes on each other City. Cities represent stations of the Washington Metro. Place 2 white cubes on the Production action as a reminder.

Determine Player Order

In a 3-player game, use the normal auction rules.

For a 2-player game, randomly determine a start player at the beginning of the game. On future Determine Player Order phases, reverse the positions of the two players. Each turn (including the first), during the Determine Player Order phase, the first player may pay \$5 to retain their position. If they cannot or choose not to, the second player has the option to pay \$5 to claim the first player position, and if they cannot or choose not to, the original first player retains their position for free.

Production Action

When a player selects Production, in addition to the normal Production action before Goods Growth, they must **immediately** upon selecting the action place two white cubes onto any Cities and/or Towns (they may be placed on the same City/Town or different ones). Once placed, white cubes can never be delivered or removed from the board. Their only use is to aid in the delivery of other cubes (see Move Goods below).

Turn Order Action

In a 2-player game, a player who selects the Turn Order action will be considered the first player for the next turn but they must still pay \$5 or have their opponent decline to pay \$5 to keep that privilege.

Move Goods

When delivering a cube, the player must also move a cube from the origin City/Town onto each City/Town the delivered cube passes through.

Note: The length of a delivery is limited both by a player's Locomotive Level and by the number of cubes on the origin City. If there are only two total cubes on the origin City, the player could at most deliver a cube two links away, leaving one at the passed through City/Town and delivering the other to the destination City. A player may make a delivery that is shorter than the number of cubes on the origin City. In that case, they leave any unused cubes on the origin City.

The color of the cubes that are moved onto different Cities/Towns is irrelevant (any color can be placed on any City/Town passed through, even one of the same color). A cube may be placed on Cities past Cities of the same color along the route. Only the color of the cube being delivered matters and follows normal Move Goods rules, being delivered to the first City of its matching color that it reaches. Income is earned normally.

Game End

The game ends at the end of the eighth turn.

Solo Mode

Manage congestion, disgruntled passengers and maintenance station closures in this solo variant for D.C. Metro.

The solo rules follow all of the rules for the 2-3 player game with the following changes:

Start of Turn

At the start of each turn, before deciding whether to Issue Shares, roll 3 dice and set them to the side. These dice, as rolled, will be used during the Goods Growth phase.

Determine Player Order

There is no Determine Player Order phase.

Actions

Place four disks near the Actions area. The only actions available are Locomotive, Engineer, Urbanization, and Production. Each turn, you must select a different action until all four have been selected, then you uncover all actions and continue selecting a different action each turn. By the end of the game, you will have used each action exactly twice.

When selecting Production, you do not place white Goods cubes as you do in the 2-3 player game. No white Goods cubes are used in the solo game.

Move Goods

The same special rules from the 2-3 player game apply (i.e. you must move a Goods cube from the origin City onto each City/Town passed through). In addition to these rules, you may not deliver a Goods cube to a City with the Closed Station marker. A Goods cube also may not move through a City with the Closed Station marker.

Whenever you deliver a Goods cube matching the color of the cube on the lowest value share space with a cube, you also remove that cube from the Shares track (see *Goods Growth* below).

Goods Growth

Using the 3 dice you rolled at the beginning of the turn, you must choose one to close a station, one to add a Goods cube to a light City, and one to add a Goods cube to a dark City (National Airport).

First, choose which die will close a station. Place the Closed Station marker on the City whose light number matches the number on the die. The Closed Station marker will remain on that City for the entire next turn and prevents delivering Goods cubes to that City or moving Goods cubes through that City. If there were any Goods cubes on the City you are closing, remove them from that City and place them on the Shares track one Goods cube per share space in any order you choose, starting with the highest value share space with no cube with each subsequent cube placed on the next highest share space (see *Difficulty Level* below).

Second, choose one of the remaining two dice to add a Goods cube to a light City (and corresponding New City if applicable, following normal rules). If you would add a Goods cube to a City and that City already has four or more Goods cubes on it or has the Closed Station marker, place the cube instead on the highest share space with no cube. If you must place both the light City cube and New City cube on share spaces, you may place them in either order.

Finally, use the last remaining die to add a Goods cube to the dark City (always National Airport) and the corresponding New City if applicable. If you would add a Goods cube to a City and that City already has four or more Goods cubes on it or has the Closed Station marker, place the cube instead on the highest share space with no cube. If you must place both the dark City cube and New City cube on share spaces, you may place them in either order.

If at any point you place a cube onto the same share space as your disk indicating the number of shares you have issued, the game immediately ends and you lose.

Game End

The game ends immediately in a loss if you take shares so that your disk enters a share space with a Goods cube or during Goods Growth if you must place a Goods cube on the same share space as your disk. The game also immediately ends in a loss if you go bankrupt. In the event of a loss, your score is 0.

Otherwise, the game ends at the end of the eighth turn. On the eighth and final turn, you must still complete the entire Goods Growth phase which could result in a loss. If after the final Goods Growth phase you have not lost, you win! Calculate your score using the normal scoring rules.

Difficulty Level

To adjust the game’s difficulty, you may choose which space on the Shares track is considered the highest and therefore the first to receive a Goods cube. Treat any higher share spaces as if they do not exist (you neither place Goods cubes onto them nor can you ever take shares that would move your disk onto them). You may find it helpful to place disks of another player color on the share spaces that are out of play as a reminder. Use the below chart as a guide for your difficulty:

Difficulty Level	Highest Available Share Space
Easiest	15
Easier	14
Easy	13
Normal	12
Hard	11
Harder	10
Hardest	9
Brutal	8 or lower

AUSTRIA

Austria is a map for 2 players by John Bohrer.

Components

- Austria Track tile (*Town tile with 5 connections*)

Setup

During setup, place 4 Goods cubes in Vienna, 3 Goods cubes in Graz, and 2 Goods cubes in every other City on the map. Place 1 Goods cube on each of the New City tiles, A-H.

Each player starts with \$16 instead of \$10.

Use the Turn Order Track on the game board. It displays which player is the first in turn order each turn. Randomly determine a player to be Player A.

- Player A is first on turns 1, 3, 6, 8
- Player B is first on turns 2, 4, 5, 7

Issue Shares

This expansion does not use shares and the Issue Shares phase is skipped. Money is only gained in the Income phase.

Turn Order

The Turn Order action is not used.

Urbanization

Only Foreign Markets (hexes with a dashed border) may be Urbanized. Towns may **not** be Urbanized.

Build Track

- The Build Track phase works are normal with the following changes:
- May only build Completed Links
 - Place/Replace Track: \$4
 - Place/Replace Town: \$4
 - The Austria Track tile (Town with 5 connections) may be placed in Wels, Leoben, Wiener Neustadt or St Pölten for \$4
 - Mountains and heavy red hex-sides are impassable
 - There is a Complete Link between Salzburg and a Foreign Market that may be built as 1 track build of the Build Track phase for \$4
 - There are Complete Links between Innsbruck and two different Foreign Markets that may be built.

Building the \$4 Link counts as 1 track build of the Build Track phase. Building the \$12 Link counts as 3 track builds of the Build Track phase and 3 Victory Points for track segments at end of game scoring.

Move Goods

There are 3 rounds of Moving Goods instead of 2. Goods cubes may not move through Foreign Markets, but they may be moved to and/or from a Foreign Market.

Goods Growth

Roll for Goods Growth as normal. Cities in Austria (with the exception of Vienna) receive cubes from both light and dark sides of the Goods display. At the end of each Goods Growth phase, Vienna receives 2 random Goods cubes directly from the bag.

Final Scoring

After final scoring, each player receives 1 VP per \$20 cash that they retain at the end of the game.

MOON

Moon is a map is for 3 to 4 players by Alban Viard.

Mankind has started to colonize the Moon in earnest. Many lunar Towns and Cities have been founded and now they need a rail system to connect them. You are just one of a number of high-tech rail barons ready to exploit this brave new world...

Components

- Sun tile
- Satellite tile
- Engineer Action tile
- Low Gravitation Action tile

Setup

Place 2 cubes on each City. Place 2 cubes per player on the Landing hex, which will be found in the center of the map. These represent goods from Earth. Remove the black New City tiles from the game. Fill the Goods Display as usual with the exception of the black New Cities. Place the Sun tile on the night space on the top right corner of the map. This tile is used to indicate which side of the moon is day. The opposite side is night. The sides are divided by an imaginary line between X1 and X5.

Build Track

Each player is limited to building only two track tiles per turn. Players can only build from the Landing hex or a City that is connected by Complete Links to the Landing hex. This means that at the beginning of the game the first player can only build from the Landing hex, while the second player can build either from a City Linked by the first player or from the Landing hex.

Track can be built off the edges of the map and will connect to the corresponding number on the opposite side. i.e. Track built to the edge of the map to hex side labeled '1' on one side of the map will connect to track built to/from the hex side labeled '1' on the opposite side of the map.

Track Costs

- Towns cost \$2 + \$1 for every track section leading to the Town.
- Standard Crater hexes (light gray) cost \$3 to build simple track.
- Mountain hexes cost \$4 to build simple track.

Engineer Action

The Engineer action allows the player to build up to 3 track tiles instead of 2.

Low Gravitation Action

This new action, Low Gravitation, allows a player the use of one Complete Link that belongs to another player as if it was owned by the player selecting the Low Gravitation action (i.e. also gains the income from using the link). A player may use this ability during both rounds of Move Goods in a turn.

Move Goods

The Landing hex functions as a colorless City; it does not accept or produce goods, but Goods cubes may pass through it. The Sun tile on the night space indicates that all Cities on the opposite side of the map (the night side) are temporarily black and only accept black cubes for that turn.

Goods Growth

Roll 2 dice for each player. Only Cities on the day side of the moon this turn that are connected to the Landing hex by Complete Links can receive goods. No Cities on the night side of the moon receive Goods cubes. After rolling for Goods Growth, move the Sun tile to the other side of the map to indicate that is day on that side for the next turn and advance the Turn

Track marker. New Cities are numbers only (not light or dark) and only produce if they are on the day side of the map during Production and the matching dice numbers are rolled.

Satellite Mini-Expansion

During setup, place the Satellite tile on the outside border of the moon in the hex space labeled X1. Place 6 cubes on the Satellite tile if playing with 3 players or 8 cubes on the Satellite tile if playing with 4 players. The Satellite will add 1 cube at the end of each turn to an adjacent hex. At the end of the turn, the player in last place on the income track (ties broken by last in turn order) chooses a cube on the Satellite tile to place on an adjacent hex, then moves the Satellite to the next position in counter-clockwise direction. X1 to X2, X2 to X3, etc.

If a player builds track over a hex with a cube, then the cube is placed on the tile and may be delivered. If the Satellite places a cube on existing track, that cube can be delivered from that track segment, per the normal Move Goods rules.

GREECE

Greece is a map for 3 to 5 players by Alban Viard.

Though rich in history and culture, Greece's financial situation is dire. To meet its never-ending bills, it is forced to borrow money from other European countries at progressively worse rates of return.

Setup

- Place 6 random Goods cubes in Athens, and 3 random Goods cubes in each other City.

Play / Issue Shares

- Shares 1-5 are worth \$5 as in the base game.
- Shares 6-10 are worth only \$4.
- Shares 11-15 are worth only \$3.

Build Track / Building Costs

Building simple track in the Corinth Canal (river) costs \$3. Track may also be built over the water hexes displaying a cost of \$3. All other track costs are the same as the base game.

Income Reduction

If a player's income is **over 49**, it is reduced by **15**, instead of 10.

If a player's income is **41-49**, it is reduced by **12**, instead of 8.

If a player's income is **31-40**, it is reduced by **9**, instead of 6.

If a player's income is **21-30**, it is reduced by **6**, instead of 4.

If a player's income is **11-20**, it is reduced by **3**, instead of 2.

SPAIN & PORTUGAL

Spain & Portugal is a map for 4 or 6 players (teams of two) or 3 to 6 players (individually). Designed by Pierre Paquet and Martin Sasseville.

There were a series of insurrections and revolts that played a significant role in shaping Spain's political and social landscape during the 19th century.

Components

- Insurrection Action tile
- 5 white Goods cubes (from the base game)
- 7 City Insurrection tiles

Teams

Players form teams of 2. Thus with 4 players there are 2 teams and with 6 players, there are 3 teams. Members of a team still Issue Shares, Determine Player Order, Select Actions, Build Track, Move Goods, Collect Income, and Pay Expenses as an individual player.

Setup

Remove the blue New City tile from the game; it cannot be placed.

Before filling the Goods Display or placing Goods cubes on the map, remove the Goods cubes from the bag. Then, place 4 black cubes, 1 red cube, 1 purple cube, 1 yellow cube, and 5 white cubes in the bag.

Towns are marked 1-12. Select a random cube from the bag and place the corresponding New City tile on Town 1. If the cube drawn is:

- Red - place red New City tile A
- Yellow - place yellow New City tile E
- Purple - place purple New City tile F
- Black - place black New City tile C
- White - do not place any New City tile

Set aside the cube selected and repeat this process for Towns 2-12. If black New City tile C has already been placed, place New City tile G instead. If New City tile G has been placed, place New City tile H instead.

After completing this process for each of the 12 Towns, all 7 New City tiles will have been placed. Remove the 5 white cubes from the game and return all other Goods cubes to the bag.

Place 4 Goods cubes on Bordeaux and Marseille and 2 Goods cubes on every other City and New Cities. Fill the Goods Display as usual. Blue Goods cubes are **not** allowed on Bordeaux and Marseille and on their Goods Display for light 5 and light 6.

Build Track

- Building simple track on a hill hex costs \$3
- Building simple track on a mountain hex costs \$5
- The heavy red hex-sides are impassable

Move Goods

Since the track gauge was different between Spain/Portugal and the rest of Europe, players must pay a \$2 for each Goods cube that is shipped to or from Bordeaux or Marseilles. If a player does not have \$2, they must move back on the Income Track 1 space for each \$1 not paid. Goods cubes are not allowed to move through Marseille or Bordeaux.

Insurrection

Urbanization is replaced by Insurrection. When a player chooses this action, they **must** immediately replace one of the New City tiles on the map with a City Insurrection tile. City Insurrection tiles have a track segment leading from a Town to each of the 6 sides of the hex. As in the basic rules, if another player extends an unowned, Unfinished Track

Section they may claim ownership of the Track by placing one of their Track Ownership disks on it. If Goods cubes were on a New City tile where an insurrection occurred, they are returned to the bag along with any cubes on the Goods Display for that City..

Victory Conditions

At the end of the game, after final scoring, combine the score of each team member to create a team score. The team with the highest team score wins, with the overall winner the player of that team with the most VP. The second player of the winning team takes second place. The members of the second place team members place 3rd & 4th and the members of the third place team place 5th & 6th, according to their final score.

Individual Players Variant

This expansion can also be played individually as a 3 to 6 player map. Victory conditions are the same as those stated in the basic game rules.

PORTUGAL: MADEIRA & THE AÇORES

Portugal: Madeira & the Açores is a map for 3 to 4 players by Vital Lacerda.

Portugal mainland is a crucial geographical presence for the two autonomous regions, the islands of Madeira and the Açores, whose exports are directed to the mainland. While the sea routes for tourism and goods play a role of great importance to these islands, they also offer luxury products to the continent.

Setup

Place 3 Goods cubes on Madeira and the Açores. Place 2 cubes in every other City on the map. Fill the Goods Display as usual, but do not place cubes for Cities #5 or #6 on either the light or dark side of the Goods Display. Goods cubes should be filled for New Cities C & D, however.

Play one less turn than usual.

Build Track

Each player may only make **one** connection to Lisboa per turn, be it by land or by sea.

The Sea Link between Porto and Lisboa and between Sines and Lisboa cost \$6 to build. The Sea Link to Sines is only Complete if a section of track is built from the Sea Link into the Town, or if Sines has been Urbanized. Each Complete Sea Link counts as 1 link when moving goods and for end-of-game scoring.

The Sea Links from Madeira to Sagres and from the Açores to Lisboa may be built by more than one player for a cost of \$6. Each player that pays the cost places a Track Ownership disk on the link.

Move Goods

When a player uses the Sea Link between Madeira to Sagres or between the Açores to Lisboa deliver a Goods cube, they may choose which player (of those who have built the Sea Link) earns the income for the link.

Goods Growth

Madeira and the Açores each receive a random Goods cube, drawn from the bag, during the Goods Growth phase of each turn. Cities #5 and #6 do not exist and no cubes are deployed on the Goods display; however, if the corresponding New Cities are in play and a 5 or 6 are rolled, then the New Cities receive goods normally.

Copyright Vital Lacerda, 2008. All Rights Reserved.

MONTREAL MÉTRO

Montréal Métro is a map for 3 players by Michael Webb.

Components

- Repopulation Action tile
- 9 Track Ownership disks of a non-player color

Setup

Place random Goods cubes on each City equal to the number shown on the City. Place a random Goods cube on each of the 8 New City tiles. The Goods Display is not used and the Goods Growth phase is skipped.

Place a disk of each player color on the Engine Track in the 1 Link / 0 Links DGEL space and on the '2 Shares' space on the Issue Shares Track on the map instead of the normal Display board. The max number of shares issued is 20.

The 9 Track Ownership disks of a non-player color are used by the Government.

Randomly Determine Player Order prior to the start of play as usual. Place a Track Ownership disk belonging to the first player in Turn Order on 1, 4, and 7 on the Turn Track. Place a disk belonging to the second player on 2, 5, and 8 on the Turn Track. Place a disk belonging to the third player on 3, 6, and 9 on the Turn Track. The disks are a reminder as to which player has control of the Government each turn. The Turn Track marker is not used.

The Master Network (Contiguous Track Rule)

All track built in Montreal must be contiguous. This means that individual players may break up their networks, but every track segment on the map must be somehow connected. This rule also applies to Government track. The sum total of all track on the map is referred to as the Master Network.

Government Links

Each turn, prior to the Issue Shares phase, a Government Link will be built. Government Links are neutral Links that any player may use, but which grant no income to the person using them.

The player who has control of the Government (the player whose disk is on the current turn on the Turn Track) may build any 1 Complete Link with the following restrictions:

- 1) The link must be part of the Master Network (i.e. it must follow the Contiguous Track rule). Note that this requirement is waived for the first Government Link, as first Government Link built will establish the Master Network.
- 2) The Government may build up to 3 pieces of track. The cost is irrelevant and the Government does not need to be efficient.
- 3) The Government may only build 1 link and it must be a Complete Link - no stubs or unfinished track.
- 4) Normal track building restrictions apply (i.e.: all track owned by the Government must ultimately lead back to a City using only the Government's track, etc.) The Government Links are marked with the non-player color disks.

Special Note: New players are advised to include Berri-UQAM in the first Government Link, though this is by no means required.

Auction Tweak

The auction is conducted normally, but if two or more players pass without making a bid, then those players do not select special actions. In the unlikely event that all three players pass without bidding, none of the players select an action.

Example: Jesse bids 4. Sean passes. Alex, who doesn't have enough money to meet his expenses otherwise, also passes. Only Jesse selects a special action this turn.

Locomotive

Selecting the Locomotive action now increases a player's Dedicated Government Engine Level (DGEL) by 1 instead of their Locomotive Level on the Engine Track. The Locomotive action is the only way to upgrade a player's DGEL.

A player increases their Locomotive Level only by skipping 1 of their deliveries during the Move Goods phase each turn. A player's Locomotive Level is recorded normally by advancing one space to the right on the Engine Track. If a player increases their DGEL (every player begins with a 0 Link DGEL), they move their player disk down a row on the Engine Track to denote the increase. Note that the expenses for the Engine Track increase when increasing DGEL. A player also cannot increase their DGEL from 1 to 2 unless their Locomotive Level is 2 or greater. This is also true for DGEL 3 & 4, which require a Locomotive Level of 4 & 5, respectively.

Urbanization

Urbanization allows the player to place a New City tile during the Build Track phase, but this placement counts as one of their three track placements for the turn. Cities / New Cities represent Stations of the Montréal Métro.

Repopulation

The Repopulation action allows the player to draw 3 cubes from the bag, and then place 1 of them directly onto any City on the map. This must be done **immediately** upon selecting the action. Cubes represent new passengers arriving to ride the Métro.

Build Track

Players may build underwater in Montreal. Towns function as they do in the base game, but represent stops on the Métro. The costs to build simple track and Towns are as follows:

Open (green) hexes: \$2, Mountain hexes: \$3, Street hexes: \$4, Water hexes: \$6 (including water hexes that also contain streets). The cost to build track into Towns (Stops) is the same as in the base game - ignore any terrain in the hex. Note: The hex between Jean-Drapeau and Longueuil costs \$5 to build simple track.

The cost to build complex co-existing track is \$1 more than the above costs. The cost to build complex crossing track is \$2 more than the above costs. Replacing track follows the standard costs.

Note that *Parc du Mont-Royal* is impassable and the three hexes cannot be built upon.

Move Passengers (Goods)

All players may use Government Links, but receive no income for doing so. Players who have accrued DGEL through selecting the Locomotive action may use up to their DGEL in Government Links for free.

Example: If a player has a 3 Locomotive Level and a 0 DGEL, they may, during a delivery, move a cube over 2 Government Links and over 1 of their own Links, collecting 1 income in the process.

Example: If a player has a 3 Locomotive Level and a 2 DGEL, they may, during a delivery, move a cube over 2 Government Links and 3 of their own Links, collecting 3 income in the process.

Expenses

A player's total expenses include the expenses from their Issued Shares plus the expenses from their position on the Engine Track.

Advance Turn Marker

During the Advance Turn Marker phase, remove the player disk from the current turn on the Turn Track and advance to the next turn.
